SUMMARY

Backend-focused developer and final-year CS student who built and runs the production ordering system for a Gujranwala bakery: a Node.js API on PostgreSQL with payments, real-time tracking and self-hosted Docker deployment. Comfortable across the stack (React, React Native); currently building a multi-tenant platform in Spring Boot.

TECHNICAL SKILLS

Backend	Node.js, Fastify, Express, REST APIs, Server-Sent Events, Web Push, JWT auth, payment gateway integration (HMAC signing); Java & Spring Boot (in progress)
Databases	PostgreSQL (transactions, LISTEN/NOTIFY, migrations), SQL, MongoDB, Firebase Firestore
DevOps	Docker, Docker Compose, Linux (Oracle Cloud), Caddy (automatic HTTPS), scheduled backups, Git & GitHub
Frontend & Mobile	React, React Native, JavaScript (ES6+), HTML5, CSS3, Firebase (Auth, FCM)
Testing & Data	node:test end-to-end API tests, Playwright; Python, NumPy, Pandas, Scikit-learn

EXPERIENCE

Freelance Full-Stack Developer | Rosheen Bakes (home bakery) Gujranwala · Feb 2026 – Present

Live: rosheenbakes.duckdns.org | Node.js, Fastify, PostgreSQL, Docker, Leaflet, Web Push

- Built and launched the bakery's ordering system end to end: customers order, see the full price with delivery, pay and track the order without messaging the owner
- Prevented duplicate orders and price tampering (0 duplicates across 50 simultaneous submissions) by adding idempotency keys and calculating every price, including map-distance delivery fees, on the server inside PostgreSQL transactions
- Pushed each order update to the customer, kitchen and rider screens in real time by combining PostgreSQL LISTEN/NOTIFY with server-sent events, and added live rider location from a shareable link with no app install
- Integrated JazzCash checkout with HMAC-SHA256 signed requests, verified callbacks and a reconciliation job; the bakery currently runs on bank transfers confirmed from a kitchen web app with push alerts
- Kept releases safe on a one-person team with 24 end-to-end tests against a real database; deployed on an Oracle Cloud ARM server with Docker Compose, automatic HTTPS and daily backups

PROJECTS

PulseCheck — API Uptime Monitoring | Node.js, Express, JWT, React

[GitHub](#)

- Built a service that runs scheduled health checks on user endpoints, stores uptime history and sends a Slack alert the moment one fails
- Secured the API with JWT authentication and hashed passwords, with all secrets kept in environment variables

AI Business Plan Generator | React, Express, Anthropic API, Firebase

[Live demo](#)

- Turns a short multi-step form into a nine-section business plan with computed financials and PDF export
- Kept the API key out of the browser by routing all model calls through an Express proxy; the public demo serves pre-generated plans, so it costs nothing to run and exposes no key

InsightHire — Career Recommendation App | React Native, Node.js, Firebase

[GitHub](#)

- Built a mobile app with a Node.js REST API that scores a Big Five personality assessment on the server and returns ranked department recommendations

Machine Learning | Python, NumPy, Scikit-learn, XGBoost

- Implemented KNN, Logistic Regression and Naive Bayes from scratch in NumPy (best: Naive Bayes, 81.97% with 5-fold stratified CV); built a four-class Android malware traffic classifier with XGBoost (92% accuracy)

EDUCATION

BS Computer Science | GIFT University, Gujranwala

Expected 2027

Harvard HSIL Hackathon participant (Apr 2026) · Code & Create Project Display 2026, Mobile App category
